### APPLIED IN EXACTLY THE SAME WAY AS REGULAR LEAD STRIP OR LEAD OVERLAY

Introducing the NEW ARCHITECTS TIN ZINC OVERLAY. Many countries throughout the world are making life very difficult to benefit from the beauty of decorative coloured glass. Stringent regulations are preventing designers and architects from introducing many wonderful works of art into today's building developments. Hopefully 2006 will bring a smile to the faces of these people. If an elegant stained glass window is something that is missing from your workplace or home, due to your health and safety concerns, now you have the green light. There has always been a need for this kind of product, but to replicate the durability of lead itself, is almost impossible. Increasing demands have brought a new product to the table in the form of a special TIN ZINC formula that is 100% LEAD FREE and can be used in exactly the same way as regular overlay lead strip. Leading Architects in many countries are now demanding the use of this product in areas where normally regular lead would have been used. Visually, the product will seem very similar to regular lead strip, but the new Architects overlay is a product in its own right. It will not oxidize, it will not discolour, and its flexibility is almost the same as lead itself. Using the Architects Overlay you will be able to carry out installations in almost any area or place imaginable, including hospitals, schools, children's rooms, shower doors and areas you wish to see that elegant decorative glass window.
